

Congratulations!

You've completed **course 9: Deploy your first agent!** Your agents are now production-ready and accessible 24/7 from anywhere in the world.

What you learned

Part 1: Understanding deployment

- Local vs cloud deployment
- Google Cloud setup (account, APIs, billing)
- When to deploy agents to production

Part 2: Deploy to Agent Engine

- One-command deployment: `adk deploy agent-engine`
- Automatic session persistence (VertexAiSessionService)
- Testing via Python SDK

Shell

```
adk deploy agent-engine \  
  --project=$PROJECT \  
  --region=$REGION \  
  --staging_bucket=$BUCKET \  
  --display_name="My Agent" \  
  /path/to/agent
```

Part 3: Production memory

- Session State vs memory bank
- When you need cross-session learning
- Memory Bank for long-term personalization

None

```
Session State: "What's happening THIS conversation?"  
Memory Bank:  "What have I learned ACROSS ALL conversations?"
```

Part 4: Deploy to Cloud Run

- Alternative deployment option
- Web UI with `--with_ui` flag
- When to use Cloud Run vs Agent Engine

Shell

```
adk deploy cloud_run \  
  --project=$PROJECT \  
  --region=$REGION \  
  --service_name=my-agent \  
  --with_ui \  
  /path/to/agent
```

Quick reference

Deployment options

Platform	Best For	Key benefit
Agent Engine	Standard ADK agents	Simplest (one command)
Cloud Run	Custom needs	Flexibility (web UI)

Memory options

Type	Scope	Use case
Session state	Current conversation	Request tracking, flow
Memory bank	All conversations	Preferences, history

Key points to remember

- Default to Agent Engine for simplicity
- Use Cloud Run when you need web UI or custom containers
- Session state + memory bank = complete memory architecture
- All course 4 namespaces work in production

Your journey complete

None

courses 1-3: Build agents (models, tools, instructions)
courses 4-6: Add capabilities (state, tools, guardrails)
courses 7-8: Coordinate workflows (multi-agent, orchestration)
